

t.me/prvpane | Cash App Load Method 2023

Updated 2023 | more detailed tutorial with multiple ways to cashout added
-prvpane

First thing you need to get started is an unused / new cashapp so we have an account we can load the card to

You can:

- Make a new account on another phone (reinstall cashapp if its already installed)
- Use a friends cashapp if he's never done loads on the account

t.me/prvpane

When making a new cashapp account you can either sign up with a new email or phone #, for emails you can make a new gmail on the gmail app or buy a google voice account or buy a new sim to sign up with a phone number

If you are making your own cashapp you'll need a fullz to verify the account (The fullz doesn't have to match the cc holder but it's a better chance hitting and lasting longer if it is matching)

The fullz will allow you to semi-verify your cashapp so you can add the fresh spammed cc to the account

MAKE SURE TO USE VPN OR USE DATA ON THE ACCOUNT YOUR LOADING ON (I recommend ivpn for vpns)

If the loading account asks to add a debit card to link a bank account upon login DO NOT ADD IT UNTIL YOU ARE INTO THE ACCOUNT BEFORE WASTING THE CC

Once you've loaded the card onto the account, you can start loading the account of your choice

Now you will start requesting \$100-300 each time from the account you want the money transferred to.

Options:

You can use your personal cashapp to request the \$ but if you use your own I recommend you not overdue the amount of loads (under 10k in balance) so you will not run into any issues with your account

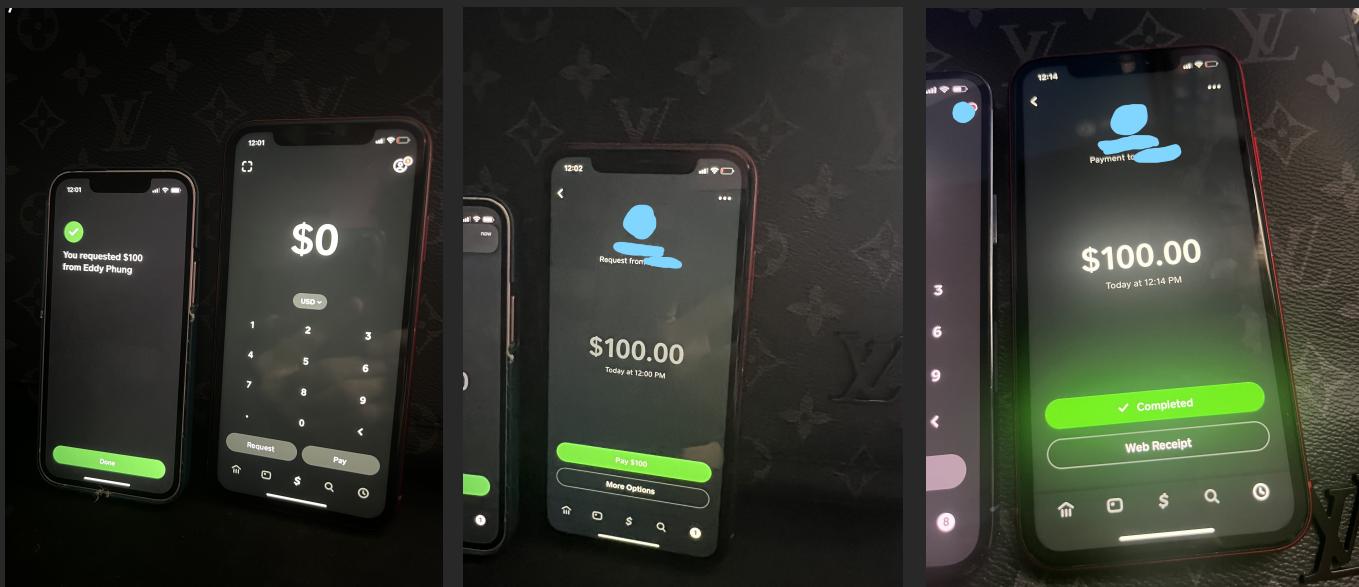

If you get a burner account and verify it with someone else information you can start hitting bigger loads and start moving money around to btc, bankdrops, etc.

Once you loaded your account you can use it however you want, cashing out to bank, buying btc, or spending it with cash card works
