

The builds from the RAT completely fail to execute on most devices even with multiple attempts at fixing the build:

The website dashboards point out heavy AI use patterns, as well as traditional tech stack AI uses for projects like these: React, Shadcn components, React icons

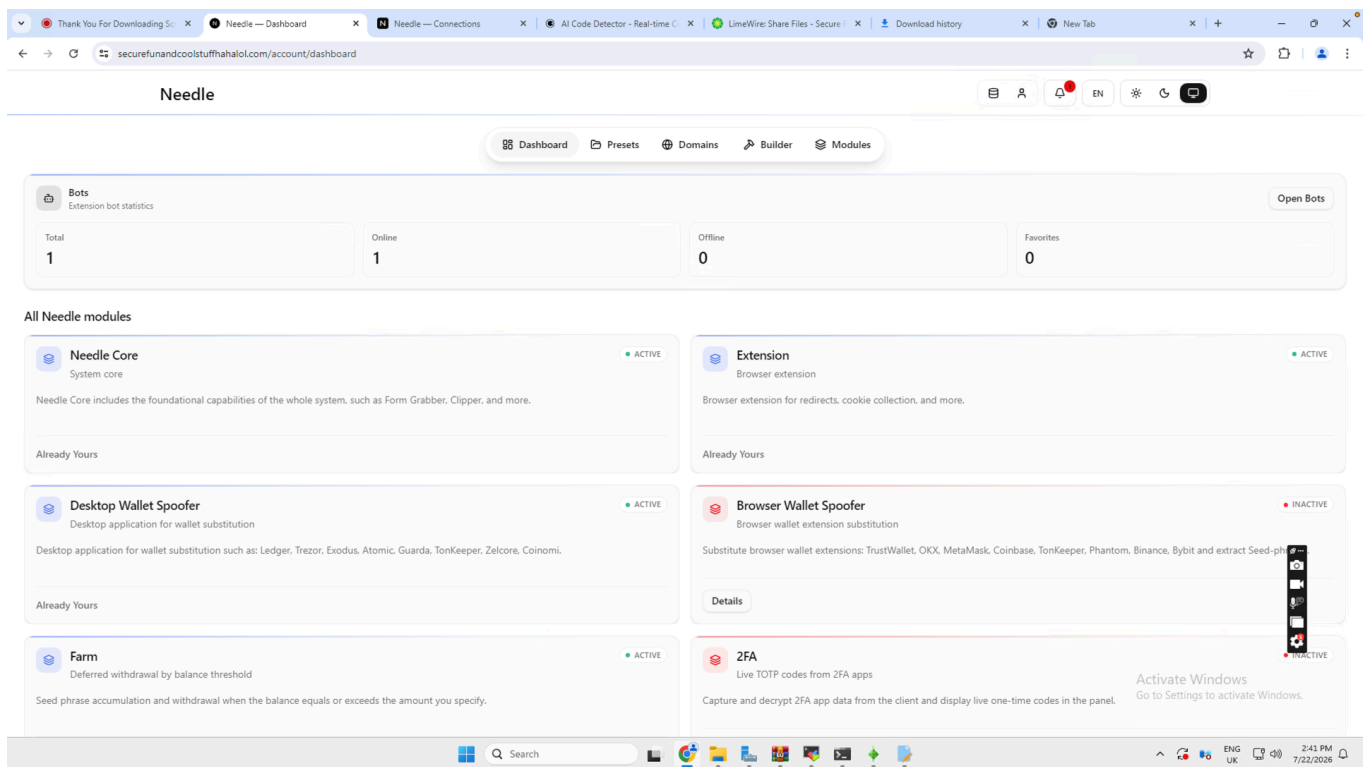

the dashboard for the rat is using generic build patterns, and default react icons heavily pointing out that it is completely AI made

It also heavily uses border effects that traditional AI models use

The other dashboard given with this project tries even less to hide it and you can see traditional AI border patterns everywhere as well as over describing fields and using default react icons

when testing built applications of this program after discussing with the creator of it that I think its AI made, we tested on multiple VMS, Actual physical computers, as well as normal windows server VPS's and found the following errors:

1. malware not working on all pcs giving dll errors
 2. only working for rdp
 3. start up not working on your malware
 4. when using vnc it disconnects the victim as soon as you click vnc button
 5. wallet replacer corrupting files
- on most computers the compiled version failed to execute completely.
